

Cell Phone Tower Location and Size in Maine

Cell phones are quickly becoming a necessary tool for personal and commercial use. Shown here is the distribution, as well as the relative sizes, of towers located in the state of Maine. The population information illustrates these towers' relation to high densities of people. The roads on the map indicate major state roads, and they illustrate the proximity of towers to these roads. The patterns of distribution and location have direct implications for the movement of peoples, the expansion of development, and growth of business in Maine.

Created by Andy McEvoy, 10 March 2009, using ArcGIS 9.3 software available from the Colby College Environmental Studies Department. 2007 census block population data obtained from ESRI website. All other data layers were obtained from the Maine Office of GIS website.
