This map shows the habitat suitability for the U.S. Fish and Wildlife Service 91 Priority Trust Species of Downeast Maine (Hancock and Washington counties). The shading of colors for different areas represents the different levels of suitability based on number of species found there and suitability models for each of those species. Habitats for each species were mapped and ranked from actual sightings or by developing habitat suitability models reflecting environmental requirements for each species. Scores for each species were then added to derive the sum of scores for all species combined. The value for each cell reflects both the number of species using each cell and the relative habitat suitability for those species. Major roads are also included on the map to show their relationship and proximity to different habitat suitability areas.
